

New Calibration curves

– is it of any significance?

In order to transform ^{14}C results to calendar years we need to use calibration curves. The importance of using good calibration curves is therefore pertinent. In connection with the new calibration curves, published in August, we would like to explain briefly about the work leading to the new curves and present the most relevant curves for Danish archaeologists. Given examples, show where the new curves differs the most. The high resolution of the new calibration curves are most of all a big improvement, but some periods and events also clearly attracts more attention.
